SMITH COUNTY JAIL PROJECT

Inmate Tracking & Navigation Database

Database	scj_db	**Platform**	MongoDB
Collections	inmates, meetings, quarterly_reports	**Prepared**	March 2025

1. What This Database Does

The Smith County Jail database replaces the existing Excel workbook with a structured, queryable system that tracks every inmate from booking through release. Instead of managing information across 19 separate spreadsheet tabs, each inmate has a single record that holds everything — who they are, what they're charged with, where they are right now, where they've been, and what plans are in place for their release.

The database mirrors the exact workflow already in use. Every list currently tracked as a separate Excel sheet — CH, MSU, HOSP, RETURN, NAVIGATION, WATCH LIST, the court sheets, RELEASED, RESTORED, and both medication lists — becomes a filter on the inmate's current status field. Nothing is lost; it's all in one place and easy to search.

2. What It Tracks

The following table shows every category of information stored per inmate:

Category	What Is Stored
Inmate Identity	Name, SO number, date of birth, race, sex, attorney
Legal Information	Offense, degree, assigned court, arrest date, court dates
Current Status	Where the inmate is right now — CH, MSU, JBCR, Hospital, Navigation, Watch List, Released, Restored, and more
Housing / Unit	Current cell or housing unit assignment
Incident Tracking	Disciplinary incidents (DISC), Use of Force incidents (UOF), number of jailings, move count
Hospital Tracking	Hospital location, transfer date, and return date
Forensics / JBCR	Forensic commitment status, 46B order date, JBCR start/end, restoration status, NGRI flag
Medications	Compulsory medication flag, medication type (AC or UT), and medication notes
Movement History	A full log of every status change — date, from/to status, unit, and notes
Discharge Planning	Housing, transportation, medical, food, employment, ID, chemical dependency, medication supply, and community referrals at release
Navigation Plan	Goals, release transportation, appointments, referrals, and navigator notes
Timing Out Flag	Identifies inmates approaching the end of their jail time for proactive release planning
Comments	Free-text notes field mirroring the comments column in the existing Excel workbook
Meeting Logs	Forensics meeting notes with action counts per list and discussion items

Category	What Is Stored
Quarterly Reports	Aggregate stats — charges, inmate counts, re-arrests, medical issues, and full disposition breakdown by quarter

3. Sample Records

The records below are representative samples based on the actual structure of the workbook. Each row is a single inmate document in the database — the same inmate that would previously appear on one or more Excel sheets.

SO#	Name	Sex	Age	Unit	Court	Offense / Degree	Status
188901	**GRANT, LATOYA**	F	26	2H	475TH	THEFT PROP $2500-$30K / FS	**CH**
176344	**HARRIS, DARNELL**	M	31	MSU-1	007TH	AGG ASSAULT W/DEADLY WEAPON / F2	**MSU**
162788	**BROOKS, MARCUS**	M	35	3I	241ST	ARSON SBI / F1	**RETURN**
191047	**WALKER, JEROME**	M	48	HOSP	007TH	AGG ROBBERY / F1	**HOSPITAL**
194312	**SIMMONS, BRENDA**	F	45	2L	114TH	DWI 3RD OR MORE / F3	**NAVIGATION**
196540	**COOPER, RYAN**	M	23	202	CCL3	BURGLARY OF VEHICLE / MA	**WATCH_LIST**
192876	**EDWARDS, MARCUS**	M	22	3E	241ST	AGG ROB X2 SEX ASLT CHILD / F1	**RESTORED**
188786	**SHEA, TAMMY**	F	59	—	—	DWI 3RD OR MORE / F3	**RELEASED**

4. How Status Tracking Works

Every inmate has a current_status field that replaces the Excel sheet-tab system. When an inmate moves from one list to another — say, from a court sheet to the hospital list — the app updates their status and appends a record to their movement history. No more copying rows between tabs.

Status Value	Description
CH	Clearinghouse — inmate flagged for the CH list
MSU	Maximum Security Unit
HOSPITAL	Currently transferred to a state hospital
RETURN	Returned from state hospital
NAVIGATION	Active in the jail navigation program
WATCH_LIST	On the watch list
007 / 114 / 241 / 475 / CCL	Court-specific active tracking (replaces individual court sheets)
JBCR	Jail-Based Competency Restoration — active
BOND	Released on bond
RESTORED	Competency restored
RELEASED	Released from jail — case closed

Every status change is also recorded in the inmate's movement history, which looks like this for an inmate who has been through multiple statuses:

Date	From	To	Unit	Notes
06/10/2022	—	241	3I	Booked
07/01/2022	241	JBCR	3I	JBCR order entered
03/13/2024	JBCR	HOSPITAL	HOSP	Transferred to Vernon State Hospital
03/24/2025	HOSPITAL	RETURN	3I	Returned from Vernon

5. Quarterly Reporting

Quarterly report data is stored separately and can be pulled instantly. The database also supports generating these numbers automatically from live inmate data rather than counting manually.

Q1 2024 (JAN–MAR)			
Total Charges	**38**	**Inmates in Jail**	**62**
Re-Arrests	**22**	**Medical Issues**	**26**

Disposition	Count
Probation	**7**
Time Served	**24**
TDCJ	**9**
Charges Dismissed	**20**
Declined to Prosecute	**17**
Surety Bond	**20**
PR Bond	**26**
POW	**4**
Forensics List	**39**
Other	**1**
NGRI	**1**
Not Guilty	**1**

6. What You Can Ask the Database

Below are examples of the kinds of questions the database can answer instantly. These replace manual searching through the spreadsheet.

Query 1: Who is currently active (not released)?

Returns every inmate not yet released, sorted by name — equivalent to scanning all active Excel tabs at once.

```
db.inmates.find({ current_status: { $ne: "RELEASED" } }).sort({ "name.full": 1 })
```

Query 2: Pull up a specific inmate by SO number

Returns the full record for one inmate. This is the primary lookup — the SO number is the unique key.

```
db.inmates.findOne({ so_number: 162788 })
```

Query 3: Who is on the Clearinghouse list?

Returns everyone currently flagged for CH — replaces manually scanning the CH sheets.

```
db.inmates.find({ ch_flag: true })
```

Query 4: Who is currently at a state hospital?

Returns all inmates in HOSPITAL status along with their hospital location and transfer date.

```
db.inmates.find({ current_status: "HOSPITAL" },   { "name.full": 1, hospital_location: 1, hospital_start:
1, court: 1 })
```

Query 5: Who is timing out?

Returns all inmates flagged as approaching the end of their jail time — for proactive release planning.

```
db.inmates.find({ timing_out: true })
```

Query 6: Who is on compulsory medications?

Returns all inmates on compulsory meds, with type (AC or UT) and notes — replaces the AC MEDS and UT MEDS sheets.

```
db.inmates.find({ compulsory_meds: true },   { "name.full": 1, meds_type: 1, medication_notes: 1,
current_unit: 1 })
```

Query 7: How many inmates are on each list right now?

Groups all records by status and returns a count — instantly recreates the summary counts from the SUMMARY sheet.

```
db.inmates.aggregate([   { $group: { _id: "$current_status", count: { $sum: 1 } } },   { $sort: { count: -
1 } } ])
```

Query 8: How many active inmates does each court have?

Groups non-released inmates by court assignment — replaces the per-court count on the SUMMARY sheet.

```
db.inmates.aggregate([   { $match: { current_status: { $ne: "RELEASED" }, court: { $ne: null } } },   {
$group: { _id: "$court", count: { $sum: 1 } } },   { $sort: { _id: 1 } } ])
```

7. How It Was Built

- One document per inmate — everything about that person lives in one place instead of being split across multiple rows and sheets.
- Current status replaces sheet tabs — filtering by current_status recreates any view from the original workbook.
- Movement history is automatic — every status change is logged with a timestamp, so the full trail is always available.
- The SUMMARY dashboard is generated live — the app calculates the court counts, hospital breakdowns, and list totals from real inmate data rather than storing a snapshot.
- Discharge plans and navigation plans are stored inside the inmate record — they're 1-to-1 with the inmate so there's no need for a separate table.
- SO number is the primary key — unique, indexed, and used as the main lookup across all queries.
